

Karnataka Gruhalakshmi Scheme

Beneficiary Integrity & Life-Proof Platform

Detailed project report presentation | Household de-duplication | Configurable retention | Periodic life-proof | DBT continuity controls

**For review and scope validation
Commercials excluded**

**Service-centre + mobile/web
registration model**

**Audit-ready decisioning
and grievance path**

Why the renewal platform is needed

The scheme is large enough that small data-quality gaps create material fiscal and trust risk.

Sources: GoK WCD scheme page; PRS Budget Analysis 2026-27; Indian Express and Times of India reporting, June 2026.

Proposed solution at a glance

A transparent beneficiary integrity platform, not merely a deactivation engine.

Target operating model

Five operating layers convert policy into controlled, citizen-friendly execution.

Process flow: registration and household consolidation

The process is designed to make a decision explainable, configurable and appealable.

Address matching and configurable retention

Matching should use confidence scoring, not exact string matching alone.

Recommended: automatic decisions only for high-confidence clusters; lower-confidence matches go to manual review before DBT impact.

Life-proof cycle and DBT control

Periodic re-verification confirms that the retained beneficiary remains alive and eligible.

Design safeguards

Mock-up screens: beneficiary experience

Designed for mobile-first, Kannada/English, high-contrast and assisted self-service.

No decision should depend only on operator judgement; the operator captures evidence and the platform records the decision reason.

Mock-up screens: admin and call-centre workbench

Operational teams manage rules, exceptions, appeals and beneficiary communications.

Scheme Admin Dashboard

Retention rule	Oldest member
Life-proof interval	Every 2 months
Grace period	15 days
Notice template	Kannada + English

Approve policy configuration / Publish to districts

Call Centre Case View

Beneficiary	Lakshmi R.
Status	Inactive - life-proof pending
Next action	Book service-centre visit
SLA	2 days remaining

Create appeal / Send SMS / Escalate to district officer

High-level architecture

A modular architecture separates citizen channels, decisioning, DBT and audit.

Privacy, security and inclusion controls

Controls should be embedded into process and product design from day one.

Consent first
Clear purpose, data use and authentication consent.

Minimum data
No raw biometric storage; retain only required references.

Role-based access
Separate beneficiary, operator, call-centre and admin rights.

Auditability
Immutable logs for consent, decisions, overrides and DBT updates.

Inclusion
Assisted centre, alternative verification and appeal path.

Accessibility
High contrast, large fonts, Kannada/English and screen-reader labels.

Based on UIDAI consent guidance and DPDP-aligned purpose limitation, notice, access control and grievance principles.

Implementation roadmap

A phased rollout reduces operational risk and protects beneficiaries.

Governance, MIS and success measures

Dashboards should track both leakage reduction and beneficiary exclusion risk.

Leadership decision rhythm: daily rollout command centre, weekly district review, monthly policy and audit committee.

Decision asks and immediate next steps

The next phase should validate policy, legal, integration and operating assumptions.

Outcome: a transparent, configurable and audit-ready beneficiary integrity system that protects public funds while protecting eligible beneficiaries from accidental exclusion.
